About

We have all been in situations where it is necessary to run to the tablet with flights to look at the arrival time or departure gate. It can be difficult when you are far away from them or not at the airport at all. We have a solution for this problem, our project is an airport system in which you can easily view all the information you need.

Our Vision

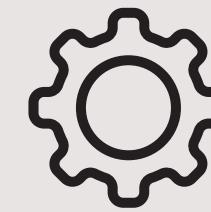

We are aware of the problems and inconveniences that may arise during the trip and in the future we plan to implement the functions necessary for the trip in one project

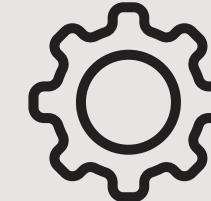

Our Mission

Our goal is to simplify the use of airports. The user will be able to view the flight, gate and time, and administrators will have the opportunity to accurately change flight data.

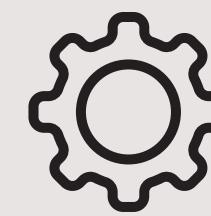

Features

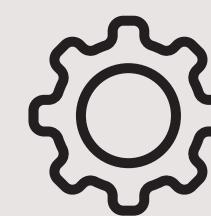

Access to information from the first page, without the need to register and log in

It is possible to correct and add information only to administrators

Intuitive clarity of the page and the project as a whole

 Lorem ipsum dolor sit amet,
consectetur adipiscing elit.

Our Competitors

There are few services in our country offering convenient functionality and few competitors specifically for the project

Kaspi offers convenient systems for Railway systems, not limited in terms of airport systems.

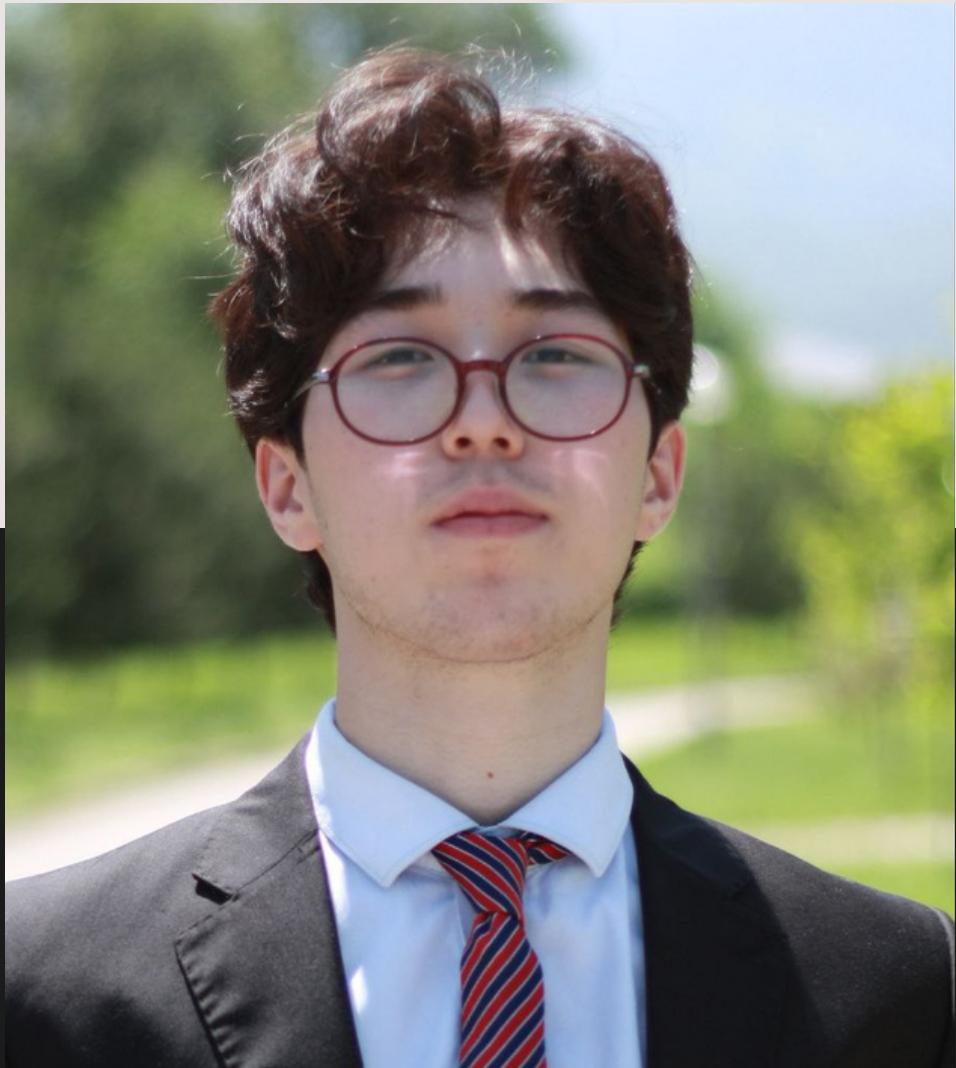

Kiwi offers convenient functions for buying and tracking trips, as well as booking, but you cannot view individual airport data

There are no direct competitors for the project, so it can potentially enter the market
